

Research Program for High School Students

The summer vacation season provides an excellent opportunity to engage in research activities that students may not have had the chance to explore during regular academic periods. For students with a keen interest in computers, they may aspire to undertake their own app development projects. While coding skills are undoubtedly important, developing efficient and high-quality apps can be challenging without understanding the app's purpose, user requirements, and conducting proper analysis and design. Analysis and design play a crucial role in preventing issues and facilitating efficient development throughout the entire process.

July 8th to August 26, 2023

Analysis & Design for App Development

Understanding the Software Development Lifecycle

Inducing In-Depth Learning in Computer Science

Application in University Admission Applications
